Danger Level 1 - Low

Persistent weak layer

Few avalanche prone locations.

The avalanche danger is low. Persistent weak layer is a persistent weak layer. Small avalanches can be triggered occasionally with little additional load. Avalanche prone locations can be found on very steep slopes in the northern and eastern aspects.

With sunlight, wet avalanches can occasionally release on their own in very steep terrain. They remain small.

Snowpack

Up to high altitudes, the snow cover, snowpack is soaked to the ground in many places and crusted can form on the surface. On sunny slopes, it softens during the daytime changes. At higher elevations, older wind slabs are lying on dry, angular layers in places. The snow depths are below average.

Tendency

The avalanche danger remains low.
